

Why Sleep Is Essential For Health

**Productivity and concentration | Managing weight | Calorie Regulation
Athletic Performance | Healthy Heart | Social and Emotional Intelligence
Depression | Inflammation | Immune System | Sleep Recommendations**

Rest is an important part of a healthy lifestyle for all ages. It rejuvenates your body and mind, regulates your mood, and is linked to learning and memory function. On the other hand, not getting enough rest can negatively affect your mood, immune system, memory, and stress level. Ask any physician and they will tell you rest is essential for physical health. When the body is deprived of sleep, it is unable to rebuild and recharge itself adequately. Your body requires rest. Sleep is a vital, often neglected, component of every person's overall health and well-being.

Sleep is important because it enables the body to repair and be fit and ready for another day. Getting adequate rest may also help prevent excess weight gain, heart disease, and increased illness duration. Recent research has revealed that people perform better at work and in life if we practice strategic renewal. If you're rundown you're more susceptible to getting sick and miss days from work. You need to get more sleep during the week, scheduling daytime workouts, eat healthy foods, and enjoy rest and relaxation away from the office with your team members whenever possible. Humans aren't designed to run on high level without having a period of rest and relaxation. You need a time for renewal. It allows you to relax and rejuvenate your mind and body.

Getting enough sleep is essential for helping a person maintain optimal health and well-being. When it comes to their health, sleep is as vital as regular exercise and eating a balanced diet. Modern-day living in the United States and many other countries does not always embrace the necessity for adequate sleep. Yet, it is important that people make an effort to get enough sleep regularly.

The following are some of the many benefits health professionals associate with getting a good night's rest.

1. Better productivity and concentration

Why Sleep Is Essential For Health

Pinterest Research has linked getting enough sleep to better concentration, productivity, and cognition. There were several studies that scientists did in the early 2000s that looked at the effects of [sleep deprivation](#). What the researchers concluded is that sleep has links to several brain functions, including:

- concentration
- productivity
- cognition

A more recent 2015 study in the *Journal of Child Psychology and Psychiatry* showed that children's sleep patterns can have a direct impact on their behavior and academic performance.

2. Lower weight gain risk

The link between weight gain and [obesity](#) and short sleep patterns is not completely clear.

There have been several studies throughout the years that have linked obesity and poor sleep patterns.

However, a more recent study in the journal *Sleep Medicine* concludes that there is no link between being overweight and sleep deprivation.

This research argues that many previous studies fail to account adequately for other factors, such as:

- drinking alcohol
- living with [type 2 diabetes](#)

Why Sleep Is Essential For Health

- level of physical activity
- education levels
- long working hours
- long sedentary time

A lack of sleep may affect a person's desire or ability to maintain a healthful lifestyle, but it may or may not be a direct contributor to weight gain.

If you're curious to learn more evidence-based information about the fascinating world of sleep, visit [our dedicated hub](#).

3. Better calorie regulation

Similarly to gaining weight, there is evidence to suggest that getting a good night's sleep can help a person consume fewer [calories](#) during the day.

For example, one study in the [Proceedings of the National Academy of Sciences of the United States of America](#) says that sleep patterns affect the hormones responsible for appetite.

When a person does not sleep long enough, it can interfere with their body's ability to regulate food intake correctly.

4. Greater athletic performance

Share on Pinterest Getting a sufficient amount of sleep can boost a person's athletic performance.

According to the [National Sleep Foundation](#), adequate sleep for adults is between 7 and 9 hours a night, and athletes may benefit from as many as 10 hours. Accordingly, sleep is as important to athletes as consuming enough calories and nutrients.

One of the reasons for this requirement is that the body heals during sleep. Other benefits include:

- better performance intensity
- more energy
- better coordination
- faster speed

Why Sleep Is Essential For Health

- better mental functioning

5. Lower risk of heart disease

One risk factor for heart disease is high blood pressure. According to the Centers for Disease Control and Prevention (CDC), getting adequate rest each night allows the body's blood pressure to regulate itself.

Doing so can reduce the chances of sleep-related conditions such as apnea and promote better overall heart health.

6. More social and emotional intelligence

Sleep has links to people's emotional and social intelligence. Someone who does not get adequate sleep is more likely to have issues with recognizing other people's emotions and expressions.

For example, one study in the *Journal of Sleep Research* looked at people's responses to emotional stimuli. The researchers concluded, similarly to many earlier studies, that a person's emotional empathy is less when they do not get adequate sleep.

7. Preventing depression

The association between sleep and mental health has been the subject of research for a long time. One conclusion is that there is a link between lack of sleep and depression.

A study appearing in *JAMA Psychiatry* examines patterns of death by suicide over 10 years. It concludes that lack of sleep is a contributing factor to many of these deaths.

Why Sleep Is Essential For Health

Another study in the *Australian and New Zealand Journal of Psychiatry* suggests that people with sleep disorders such as [insomnia](#) are likely to show signs of depression.

8. Lower inflammation

There is a link between getting adequate sleep and reducing [inflammation](#) in the body.

For example, a study in the *World Journal of Gastroenterology* suggests a link between sleep deprivation and inflammatory bowel diseases that affect people's gastrointestinal tract.

The study showed that sleep deprivation can contribute to these diseases — and that these diseases, in turn, can contribute to sleep deprivation.

9. Stronger immune system

Sleep helps the body repair, regenerate, and recover. The immune system is no exception to this relationship. Some research shows how better sleep quality can help the body fight off infection.

Why Sleep Is Essential For Health

However, scientists still need to do further research into the exact mechanisms of sleep in regards to its impact on the body's immune system.

Sleep recommendations

Share on Pinterest Spending more time outside can improve sleep quality.

Sleep needs vary from person to person, depending on their age. As a person ages, they typically require less sleep to function properly.

According to the [CDC](#), the breakdown is as follows:

- **Newborns (0–3 months):** 14–17 hours
- **Infants (4–12 months):** 12–16 hours
- **Toddler (1–2 years):** 11–14 hours
- **Preschool (3–5 years):** 10–13 hours
- **School age (6–12 years):** 9–12 hours
- **Teen (13–18 years):** 8–10 hours
- **Adult (18–60 years):** 7-plus hours
- **Adult (61–64 years):** 7–9 hours
- **Adult (65+ years):** 7–8 hours

As well as the number of hours, the quality of sleep is also important. Signs of poor sleep quality include:

- Waking in the middle of the night.
- Still not feeling rested after an adequate number of hours sleep.

Why Sleep Is Essential For Health

Some things a person can do to improve sleep quality are:

- Avoiding sleeping in when you have had enough sleep.
- Going to bed around the same time each night.
- Spending more time outside and being more active during the day.
- Reducing [stress](#) through exercise, therapy, or other means.
